

The function require a list and return one element, if possible the last one. If the list is only one element it returns that element.

```
Prelude> last [1]
1
Prelude> last [Nothing]
Nothing
Prelude> last [1..5]
5
Prelude>
```

The function cannot work with an empty list, because there's no last element in an empty list.

```
Prelude> last []
*** Exception: Prelude.last: empty list
```
